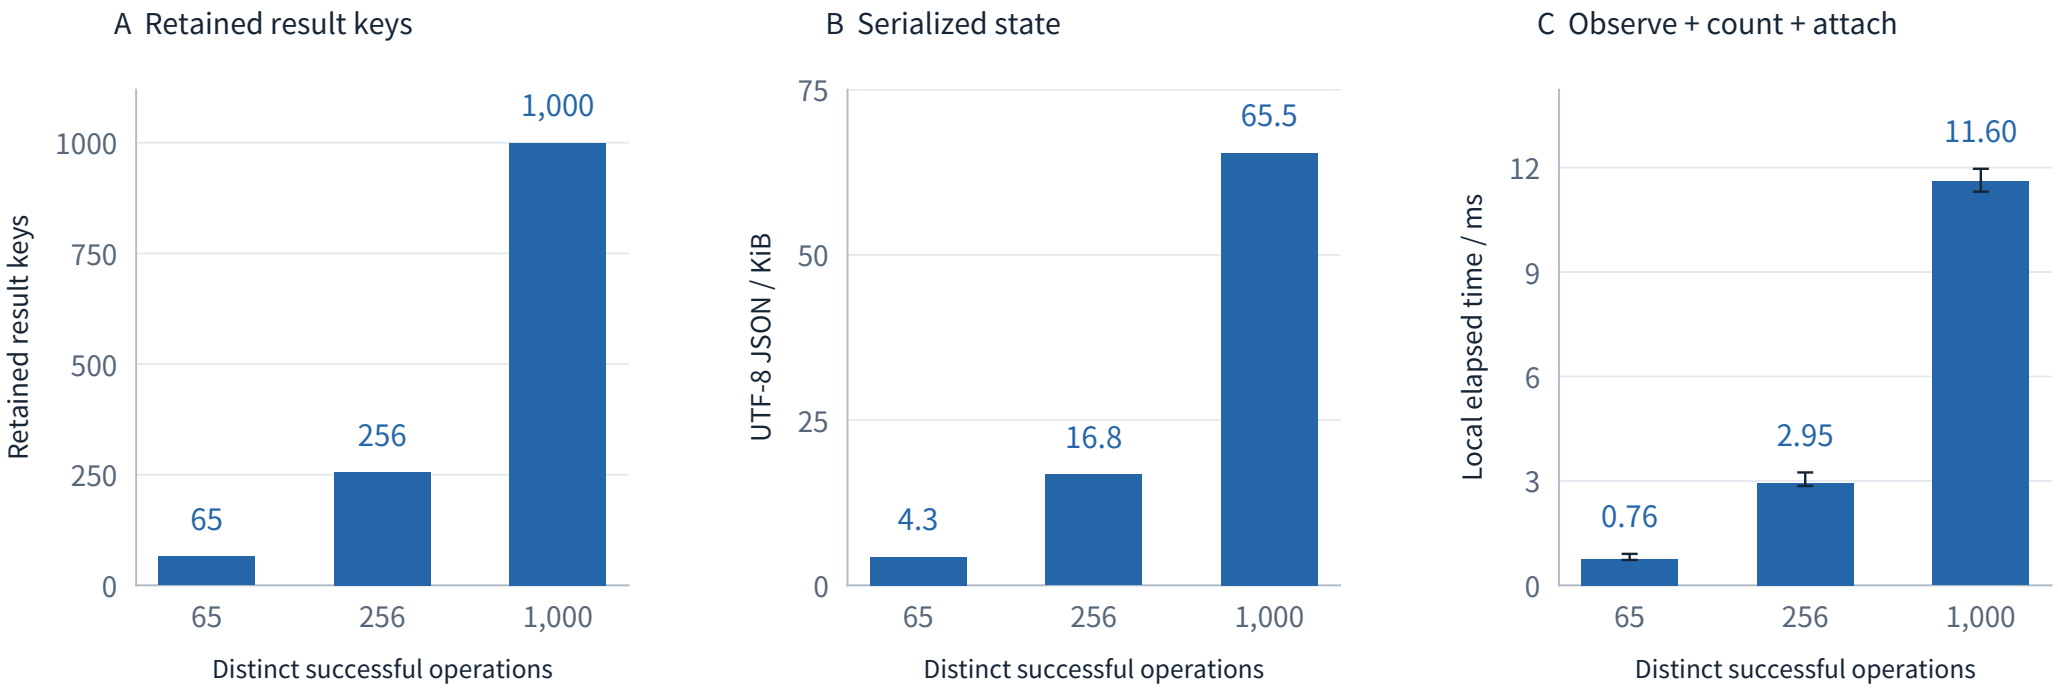
Beyond 64 operations: retain every observed result

Fixed-input stress check: retain all distinct successful results; replaying them still increments the no-progress count.



C: n = 25 local measurements per input; bars = medians, whiskers = min–max, not confidence intervals. arm64 • Python 3.12.13.

B measures UTF-8 JSON for operation_progress only, not database, checkpoint or total memory usage.

This stress check is not a >64-operation browser E2E or model/network latency benchmark. Existing stop conditions remain.

Source: core-size-timing.json. Replaying each input yields no-progress count = 1. 1 KiB = 1,024 bytes.
